

[HummingbirdCore](#) / [Request](#) / ifNoneMatch(headers:eTag:context:process:)

Instance Method

ifNoneMatch(headers:eTag:context:process:)

Conditional request which will only be processed if the eTag supplied is not in the If-None-Match request header.

```
func ifNoneMatch(  
    headers: HTTPFields = [:],  
    eTag: String,  
    context: some RequestContext,  
    process: () async throws -> some ResponseGenerator  
) async throws -> Response
```

Parameters

headers

Headers to add to response when condition fails

eTag

ETag for this responses content

context

Request context

process

Closure to run if eTag is not in the If-None-Match header

Return Value

Response

Discussion

For GET and HEAD methods, to update a cached entity that has an associated ETag.
