

[Hummingbird](#) / [RouteCollection](#) / `group(_:context:)`

## Instance Method

# group(\_:context:)

Return a group inside the current group that transforms the Request Context

```
func group<TargetContext>(  
    _ path: RouterPath = "",  
    context: TargetContext.Type  
) -> RouterGroup<TargetContext> where TargetContext : Request  
Context, Self.Context == TargetContext.Source
```

## Discussion

For the transform to work the Source of the transformed RequestContext needs to be the original RequestContext eg

```
struct TransformedRequestContext {  
    typealias Source = BasicRequestContext  
    var coreContext: CoreRequestContextStorage  
    init(source: Source) {  
        self.coreContext = .init(source: source)  
    }  
}
```

- Parameters
  - path: path prefix to add to routes inside this group

- **convertContext:** Function converting context
-
