

[Hummingbird](#) / [MemoryPersistDriver](#) / set(key:value:expires:)

Instance Method

set(key:value:expires:)

set value for key. If value already exists overwrite it

```
func set(  
    key: String,  
    value: some Codable & Sendable,  
    expires: Duration?  
) async throws
```

Parameters

key

Key to store value against

value

Codable value to store

expires

If non-nil defines time that value will expire in. If nil and value already exists and it already has an expiration time then original expiration time should be conserved.
