

[Hummingbird](#) / [PersistDriver](#) / create(key:value:expires:)

## Instance Method

# create(key:value:expires:)

create key/value pair. If key already exist throw `PersistError`  
`.duplicate` error

```
func create<Object>(  
    key: String,  
    value: Object,  
    expires: Duration?  
) async throws where Object : Decodable, Object : Encodable, Object : Sendable
```

## Required

## Parameters

### key

Key to store value against

### value

Codable value to store

### expires

If non-nil defines time that value will expire
