

[WSCore](#) / [WebSocketOutboundWriter](#) / `close(_:reason:)`

Instance Method

close(_:reason:)

Send close control frame.

```
func close(  
    _ closeCode: WebSocketErrorCode,  
    reason: String?  
) async throws
```

Parameters

closeCode

Close code

reason

Close reason string

Discussion

In most cases calling this is unnecessary as the WebSocket handling code will do this for you automatically, but if you want to send a custom close code or reason use this function.

After calling this function you should not send anymore data
