

[Hummingbird](#) / [ResponseEncoder](#) / encode(\_:from:context:)

## Instance Method

# encode(\_:from:context:)

Encode value returned by handler to ``HummingbirdCore/Response`

```
func encode(
    _ value: some Encodable,
    from request: Request,
    context: some RequestContext
) throws -> Response
```

## Required

## Parameters

### value

Value to encode

### request

Request that generated this value

### context

Request context
