

[HummingbirdCore](#) / [Request](#) / collectBody(upTo:)

Instance Method

collectBody(upTo:)

Collapse body into one ByteBuffer.

```
mutating func collectBody(upTo maxSize: Int) async throws -> ByteBuffer
```

Parameters

maxSize

Maxiumum size of body to collect

Return Value

Collated body

Discussion

This will store the collated ByteBuffer back into the request so is a mutating method. If you don't need to store the collated ByteBuffer on the request then use `request.body.collect(maxSize:)`.
