🔲 **Documentation**   Language: Swift

Hummingbird / Application / beforeServerStarts(perform:)

Instance Method

beforeServerStarts(perform:)

Add a process to run before we kick off the server service

```
mutating func beforeServerStarts(perform process: @escaping () async throws
```

Parameters

process

Process to run before server is started

Discussion

This is for processes that might need another Service running but need to run before the server has started. For example a database migration process might need the database connection pool running but should be finished before any request to the server can be made. Also they may be situations where you want another Service to have fully initialized before starting the server service.
