◫ **Documentation**                                                    Language: Swift

---

Instance Method

# ifUnmodifiedSince(headers: modificationDate:context:process:)

Conditional request which will only be processed if the modification date supplied is before the date in the `If-Unmodified-Since` request header.

```swift
func ifUnmodifiedSince(
    headers: HTTPFields = [:],
    modificationDate: Date,
    context: some RequestContext,
    process: () async throws -> some ResponseGenerator
) async throws -> Response
```

---

# Parameters

**headers**

Headers to add to response when condition fails

**modificationDate**

Modification date for this responses content

**context**

Request context

**process**

Closure to run if eTag is not in the `If-None-Match` header

# Return Value

Response

# Discussion

In conjunction with non-safe methods like POST, this header can be used to implement an optimistic concurrency control, as is done by some wikis: revision are rejected if the stored document has been modified since the original was retrieved, avoiding conflicts.
